1 Chapter 1

1.1 Permutations, Subsets, Multisets

Example 1.1.1. Suppose n people give their n hats to a hat check. Let $g(n)$ be the number ways hats could be given back so no person receives their own hat.

Answer.

$$g(n) = \sum_{i=0}^n \frac{(-1)^i n!}{i!}.$$

□

Example 1.1.2. Let $h(n)$ be the number of domino tilings of a $2 \times n$ rectangle using 2×1 rectangles.

Answer. 1. For all $n \geq 3$, $h(n) = h(n-1) + h(n-2)$.

2. Using rational generating function associated to linear recurrence relations:

$$h(n) = \frac{1}{\sqrt{5}} \left(\left(\frac{1+\sqrt{5}}{2} \right)^{n+1} - \left(\frac{1-\sqrt{5}}{2} \right)^{n+1} \right).$$

□

Definition 1.1.3. Let S be a finite set. A k -permutation of S is a sequence (s_1, s_2, \dots, s_k) as long as $k \leq |S|$.

The number of k -permutation of $[n]$ is

$$n(n-1)\cdots(n-k+1) = \frac{n!}{(n-k)!}, \quad \text{denoted by } (n)_k \text{ or falling factorial.}$$

Definition 1.1.4. Let $\binom{n}{k}$ denote the number of subsets of $[n]$ of size k .

Theorem 1.1.5 (Sagan 1.3.2).

$$\binom{n}{k} = \frac{n!}{(n-k)!k!} = \frac{(n)_k}{k!}.$$

Theorem 1.1.6 (Sagan 1.3.3). *We have*

1.

$$\binom{0}{0} = 1 \quad \binom{0}{k} = 0.$$

2.

$$\binom{n}{k} = \binom{n-1}{k-1} + \binom{n-1}{k}.$$

3.

$$\binom{n}{k} = \binom{n}{n-k}.$$

4.

$$\sum_{k=0}^n \binom{n}{k} = 2^n.$$

5.

$$\sum_{k=0}^n (-1)^k \binom{n}{k} = \begin{cases} 1, & n = 0 \\ 0, & n \geq 1 \end{cases}.$$

1.2 Generating Functions

Given a numerical sequence

$$a_0, a_1, a_2, a_3, \dots$$

The ordinary generating function is

$$A(x) = \sum_{n \geq 0} a_n x^n.$$

Note: $k[[x]]$ is a local ring.

Claim: $A(x)$ is invertible if and only if $a_0 \neq 0$.

Let

$$A_m(x) = \sum_{n=0}^m x^n.$$

Then

$$A(x)(1-x) = \lim_{m \rightarrow \infty} A_m(x)(1-x) = 1.$$

Two generating functions are the same if they converge to each other.

Theorem 1.2.1 (Binomial Theorem).

$$\sum_{k \geq 0} \binom{n}{k} x^k = \sum_{k=0}^n \binom{n}{k} x^k = (1+x)^n.$$

We first do some disambiguating. We use multivariables instead of just one.

$$\begin{aligned} (1+x_1)(1+x_2) \cdots (1+x_n) &= \sum_{1 \leq i_1 < i_2 < \cdots < i_k \leq n} x_{i_1} x_{i_2} \cdots x_{i_k} \\ &= \sum_{T \subseteq [n]} \prod_{i \in T} x_i \\ &= \sum_{k=0}^n \binom{n}{k} x^k \end{aligned}$$

Definition 1.2.2. Let α be any complex number, k non-negative integer. We define

$$\binom{\alpha}{k} = \frac{\alpha(\alpha-1)(\alpha-2) \cdots (\alpha-k+1)}{k!}.$$

Consider the generating function of $\binom{-3}{k}$.

$$\binom{-3}{0} = 1, \binom{-3}{1} = -3, \binom{-3}{2} = 6, \binom{-3}{3} = -10, \dots$$

First note that

$$\sum_{n \geq 0} \binom{-3}{n} x^n = \sum_{n \geq 0} (-1)^n \frac{(n+2)(n+1)}{2} x^n.$$

Then do some differentiation to $\frac{1}{1-x}$ we'll eventually be

$$(1+x)^{-3}.$$

Theorem 1.2.3 (Generalized Binomial Theorem).

$$\sum_{k \geq 0} \binom{\alpha}{k} x^k = (1+x)^\alpha.$$

This could be proved/shown by doing Taylor series expansions.

Definition 1.2.4. n multichoose k is the number of ways of choosing a multiset from $[n]$ of size k . Denoted by

$$\left(\binom{n}{k} \right).$$

Example 1.2.5.

$$\left(\binom{3}{2}\right) = \#\{11, 12, 13, 22, 23, 33\} = 6.$$

Theorem 1.2.6.

$$\left(\binom{n}{k}\right) = \binom{n+k-1}{k}.$$

Theorem 1.2.7.

$$\sum_{k \geq 0} \left(\binom{n}{k}\right) x^k = (1-x)^{-n} \quad \text{or} \quad \left(\frac{1}{1-x}\right)^n.$$

Recall $h(n)$ is the number of tilings of a $2 \times n$ rectangle.

$$\begin{aligned} h(n) &= \sum_{k=0}^{\frac{n}{2}} \binom{n-k}{k} \\ H(x) &= \sum_{n \geq 0} h(n) x^n \\ H(x) &= \frac{1}{1-x-x^2} \end{aligned}$$

Example 1.1.13, 1.1.15 from Stanley.

Definition 1.2.8. A *composition* of $[n]$ is an ordered sum of positive integers that sum to n . *k-composition* has exactly k parts.

The number of k -compositions of $[n]$ is $\binom{n-1}{k-1}$ and the number of compositions is 2^{n-1} .

Definition 1.2.9. *Multinomial coefficients* are

$$\binom{n}{a_1, a_2, \dots, a_m} = \frac{n!}{a_1! a_2! \dots a_m!} = \binom{n}{a_1} \binom{n-a_1}{a_2} \dots \binom{n-a_1-\dots-a_{m-1}}{a_m}$$

Definition 1.2.10. A permutation written in *cycle notation*:

1. each cycle has the largest element first
2. cycles arranged in increasing order by 1-st element.

Definition 1.2.11. Given $w \in S_n$, let $c_i(w)$ be the number of i -cycles in w . We define *cycle type* of w to be (c_1, c_2, \dots, c_n) .

Proposition 1.2.12. The number of permutations in S_n with cycle type (c_1, c_2, \dots, c_n) is equal to

$$\frac{n!}{1^{c_1} c_1! 2^{c_2} c_2! \dots n^{c_n} c_n!}.$$

Definition 1.2.13. We define *cycle index polynomial* of S_n to be

$$Z_n(t_1, \dots, t_n) := \frac{1}{n!} \sum_{w \in S_n} t^{\text{type}(w)}$$

Theorem 1.2.14.

$$\sum_{n \geq 0} z_n x^n = \exp(t_1 x + t_2 \frac{x^2}{2} + \dots) = \exp \left(\sum_{n \geq 1} t_n \frac{x^n}{n} \right).$$

1.3 Stirling Numbers

Stanely 1.3, 1.9

Segan 1.4, 1.5

Recall

$$z_n(t_1, t_2, \dots, t_n) = \frac{1}{n!} \sum_{w \in S_n} t^{\text{type}(w)}.$$

Definition 1.3.1. Let $c(n, k)$ be the number of permutations w of S_n with exactly k cycles.

Proposition 1.3.2 (Prop 1.3.7).

$$\sum_{k=0}^n c(n, k) t^k = t(t+1)(t+2) \cdots (t+n-1).$$

Proof.

$$\begin{aligned} \sum_{n=0}^{\infty} \left(\sum_{k=0}^n c(n, k) t^k \right) \frac{x^n}{n!} &= \exp \left(t \sum_{n \geq 1} \frac{x^n}{n} \right) \\ &= \exp \left(t \log \left(\frac{1}{1-x} \right) \right) \\ &= \exp \left(\log(1-x)^{-t} \right) \\ &= (1-x)^{-t} \\ &= \sum_{n \geq 0} (-1)^n \binom{-t}{n} x^n \\ &= \sum_{n \geq 0} \frac{t(t+1)(t+2) \cdots (t+n-1) x^n}{n!} \end{aligned}$$

□

Lemma 1.3.3 (Lem 1.3.6). The $c(n, k)$'s satisfy the recurrence

$$c(n, k) = (n-1)c(n-1, k) + c(n-1, k-1)$$

for $n, k \geq 1$.

Proof. Building up an permutation. Build one in S_n using one in S_{n-1} .

1. Our perm $w \in S_n$ has n as a fixed point: has (n) as a 1-cycle. Build the rest of w by any permutation of S_{n-1} with $(k-1)$ cycles.
2. Our permutation $w \in S_n$ has element n in a cycle of length ≥ 2 . Build by drawing diagram of a perm on S_{n-1} and changing one arrow.

□

Definition 1.3.4. We define the *stirling number of first kind* to be

$$s(n, k) = (-1)^{n-k} c(n, k).$$

Definition 1.3.5. We define the *stirling number of second kind* to be

$$s(n, k) = \text{number of set of partition of } [n] \text{ into } k \text{ blocks.}$$

Theorem 1.3.6 (Thm 1.4.2 Segal).

$$s(0, k) = \delta_{0,k} = \begin{cases} 1, & k = 0 \\ 0, & \text{otherwise} \end{cases}.$$

and

$$s(n, k) = s(n-1, k) + ks(n-1, k-1) \text{ for } n, k \geq 1.$$

Definition 1.3.7. Let $B(n)$ be the number of set partitions of $[n]$ regardless of the number of blocks.

$$B(n) = \sum_{k=1}^n s(n, k).$$

Theorem 1.3.8 (Theorem 1.4.1). $B(n)$ is defined by $B(0) = 1, B(n) = \sum_{k=1}^{n-1} \binom{n-1}{k-1} B(n-k)$ for $n \geq 1$.

1.4 Twelve Fold Way

Stanely 1.9

1.5 Integer Partitions

Let lowercase $p(n)$ equals the number of Partitions of size n . Let $p(n, k)$ be the number of partitions of n with $\leq k$ parts, which Stanley denotes as $p_k(n)$.

Theorem 1.5.1 (Theorem 1.6.2). $p(n, k)$ defined by

$$p(0, k) = \begin{cases} 0, & k < 0 \\ 1, & k \geq 0 \end{cases} \quad \text{and} \quad p(n, k) = p(n-k, k) + p(n, k-1).$$

1.6 Permutation Statistics

Stanley 1.3-1.4 Sagan 3.2

Definition 1.6.1. Given a permutation

Theorem 1.6.2 (Sagan Theorem 3.2.1).

$$\sum_{w \in S_n} q^{\text{inv}(w)} = (1)(1+q)(1+q+q^2) \cdots (1+q+q^2+\cdots+q^{n-1}).$$
